

# Glass Clad

Our glass clad insulated panel is comprised of a spandrel coated exterior glass surface laminated directly to our expanded polystyrene (EPS) or polyisocyanurate (ISO) core. The interior aluminum skin is laminated to a tempered hardboard (HDBD) or high density polypropylene (HDPP) stabilizer. These premium materials, combined with our laminating and curing process allow us to create a thermally efficient product with strength, impact resistance, flatness, and durability to meet your needs.
